

(Note on Overall Market Status Indicator: The overall market status indicator is an indicative assessment of the relative robustness and maturity of downstream markets for each material stream. The colour categorisation reflects a combination of factors including buyer availability, consistency of demand, level of market formalisation, price stability, quality sensitivity, payment reliability, and ease of material offtake. The colour scale progresses from dark green (highly robust, formalised, and stable markets with strong demand and reliable offtake pathways) to red (highly constrained or underdeveloped markets with limited buyers, weak recovery economics, and unstable demand). These assessments are indicative and may vary across geographies, scales of operation, material quality, and prevailing market conditions.)

Material	Market structure	Buyer profile	Price stability	Average credit days	Quality demands buyers	Overall of market status
PET (clear bottles)	Highly formal; PRO/EPR buyers active	Aggregators, recyclers, EPR PROs	Highly stable	7-15	Very strict on colour and contamination	
HDPE/ PP rigid	Semi-formal to formal; multi-tier aggregator chain	Blow moulding units, recyclers, FMCG packaging vendors	Stable to volatile	7-15	Strict (clean, mono-material)	
Aluminium / metals	Relatively formal; commodity-linked pricing	Scrap dealers, smelters, large traders	Highly stable	7-15	Low (easy to recycle)	
Paper/ cardboard	Informal; mill-driven but opaque	Kabadiwala chains, paper mills	Seasonal, volatile	90-120	Moderate (moisture sensitive)	
MLP/ flexible plastic	Largely informal; no formal market in most cities	Cement co-processors, aggregators	Very volatile/ fee-based		Low	

Mixed/ low-grade plastic	Informal; highly localised	Local kabadiwalas, small recyclers	Weak, easily undervalued			
RDF/ reject waste	Formal (contract-based)	Cement kilns and plants (tipping fee basis)	Stable	30	Strict	
Footwear/ rubber	Mix of brand-partnership formal and informal	Aggregators, niche recyclers	Low		Low	
Textiles	Informal	Informal recyclers, upcyclers	Low		Low	

Most MRF revenue comes from a small number of high-value materials - PET, aluminium, and clean HDPE. Everything else is sold at thin or negative margins. This makes buyer portfolio breadth, price discipline, and low-value material management the real levers of MRF financial viability.
